

# Early Spring 2019

Today your lawn was treated with: Fertilizer, crabgrass preventer and broadleaf weed control. The fertilizer should last approximately 6-7 weeks. The crabgrass preventer will stop annual weeds for the next 4 months. Remember, crabgrass in this area usually germinates between May 15th and June 1st. The fertilizer has slow release nitrogen and will be taken into the roots gradually. The broadleaf weed control will stunt or maybe control some weeds. Early Spring is a very tough time to control weeds because the flow is going up the plant to promote growth instead of into the roots. If they don't completely disappear, we will finish them off on our next application. Please water after 24 hrs for best results. You may mow after 24 hrs, **but please don't catch or bag the clippings the 1st mowing after application**

## Spring Lawn & Landscape Tips

- **Rake** lawn if possible. Besides cleaning up the lawn it also stimulates new growth. Hand raking the lawn after we have treated it will not harm our application.
- Remove any broken or dead limbs from trees and shrubs. Rake dead leaves away from perennials.
- Mow lawn this spring so grass is 2-1/2" high after cutting.
- Seeding - since we treated your lawn today, hold off any seeding until late August, unless you loosen the soil to a 2" depth to break down the crabgrass preventer.
- Prune overgrown shrubs, such as potentilla, spirea or evergreens if needed. Now is also the time to cut back shrub roses to 6" above the ground. Cut back Potentilla 6 - 8" above the ground every 2 to 3 years to prevent them from becoming woody.

Don't forget about our very popular

### Perimeter Pest

applications!!

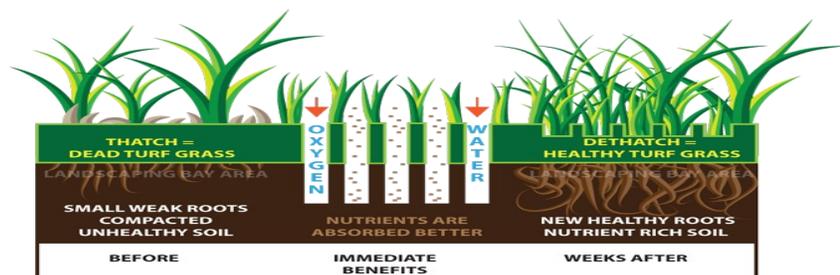

Effective at eliminating ants, spiders, earwigs, and more !!!

\$42.00 (for the average Lake home) up to 4 times a year

## Don't Hesitate to AERATE!!!

- \*\* Improves air exchange between the soil and atmosphere.
- \*\* Enhances soil water uptake.
- \*\* Improves fertilizer uptake
- \*\* Reduces water runoff and puddling by
